

## PRECAST/PRESTRESSED WALLS DATA

Precast or prestressed walls can provide an economical solution for either load bearing or cladding walls with a quality form finish that cannot be achieved with a cast-in-place or CMU wall system.

Prestressing of the wall controls stresses so several levels can be completed with one lift, eliminating the horizontal joints. Panels to forty feet (40'-0") tall can easily be achieved.

- \* Thicker sections can be provided on request.  
Consult Rocky Mountain Precast for more specific design information.
